## - What is Energy

$\qquad$ is perhaps the most central idea to all of Physics.

- The universe is made of $\qquad$ and $\qquad$ .
- Historically energy was debated as of the $\qquad$ (not known by Newton).
- Difficult to define, $\qquad$ is both a thing and a process.
- A thing in $\qquad$ waves - a process when it holds $\qquad$ together.
- Work
- FORMULA: $\qquad$ = $\qquad$ $x$ $\qquad$ $[\mathbf{W}=\mathrm{fd}]$. UNITS:
- Force is in $\qquad$ ( $\mathbf{1 N}=\mathbf{1 k g ~ m} / \mathrm{sec}_{2}$ )
- Distance is in
- Work is in $\qquad$ ( $\mathbf{1 j}=1 \mathrm{~N} \mathrm{~m}=1 \mathrm{~kg} \mathrm{~m} / \mathrm{mec}_{2}$ )
- EXAMPLE: weight lifters do $\qquad$ joules of work; a kg of gas does $\qquad$ joules of work.
- Power
- FORMULA: $\qquad$ = $\qquad$ / $\qquad$ [ Power = W/t ].
- UNITS: 1 $\qquad$ $=1$ joule $/ \mathrm{sec}$, or $1 \mathrm{horsepower}=750$ watts
- EXAMPLE: a $\mathbf{1 3 3}$ horsepower engine is a $\mathbf{1 0 0} \mathbf{~ k W}$ engine).
- Mechanical Energy ... Potential Energy (PE) versus Kinetic Energy (KE)
- Potential is due to $\qquad$ - Kinetic is due to $\qquad$ .
- Potential Energy is the $\qquad$ work - Kinetic Energy is $\qquad$ work.
- UNITS: Energy is measured in joules - just like work.
- FORMULA: $\qquad$ = $\qquad$ $x$ $\qquad$ , so [ PE = wt h ].
(Sometimes $\mathrm{PE}=\mathbf{m g h}$, where mg is mass x gravitational acceleration. Newtons or pounds are a force that already has $g$ built in.)
- FORMULA: $\qquad$ $=1 / 2$ $\qquad$ $\mathbf{x}$ $\qquad$ 2, so [ $\mathrm{KE}=1 / 2 \mathrm{mv}_{2}$ ]
- Work - Energy Theorem ... Work is the change in kinetic energy. [ W = $\mathbf{~ K K E}$ ] Derivation:
- Since $\mathbf{W}=\mathbf{f d}$
- from Newton's 2nd Law: $\mathbf{f}=\mathbf{m a}$, so $\mathbf{W}=\mathbf{f d}$ becomes $\mathbf{W}=\mathbf{m a d}$
- since $\mathbf{d}=1 / 2$ at 2 , therefore $\mathrm{fd}=\mathbf{m a d}$ becomes $\mathrm{fd}=\mathbf{m a}(1 / 2$ at $\mathbf{2})=1 / 2 \mathbf{m}(\mathrm{at})_{\mathbf{2}}$
- since $a=\Delta v / t$, then $\Delta v=$ at, therefore $1 / 2 \mathrm{~m}(\text { at })_{2}$ becomes $1 / 2 \mathrm{~m} \Delta v_{2}$
- so $\mathrm{fd}=\Delta \mathbf{1 / 2} \mathbf{~ m v 2}$, that is $\mathbf{W}=\Delta K E$
- The Law of Conservation of Energy

Energy can be converted from one form to another, but it cannot be created or destroyed.

- What is a Machine?

○ A machine is a device that can either multiply a force or simply change its direction. work input = work output $\quad . . \quad$ (force $x$ distance) ${ }^{\text {in }}=$ (force $x$ distance) out
○ The Efficiency of a machine = (useful energy output) / (total energy input)
